TECLOGOS

Corporate Website Redesign Content, Images & User Experience Guide

A practical implementation document for rebuilding the TecLogos website into a clear, credible and professional engineering-company website.

DESIGN DIRECTION ABB-inspired industrial minimalism	**CONTENT GOAL** Explain complex engineering in simple language
VISUAL STYLE White, light grey, charcoal and restrained accent colour	**PRIMARY AUDIENCE** Industrial buyers, project teams, partners and job seekers

Websites reviewed

Current redesign preview — https://teclogos.vercel.app/

Original company website — https://teclogos.in/

Prepared: 5 November 2026
Purpose: Give designers, developers, content writers and company stakeholders one shared plan for what to change, what to write and which images to collect.

How to use this document

This guide is written so that a designer, developer, company manager or someone with no engineering background can understand what TecLogos does and what the website needs to explain.

The simple explanation: TecLogos helps factories, plants and buildings use machines, sensors and computer systems to work together. These systems help people monitor equipment, control processes, spot problems and operate facilities safely and efficiently.

A child-friendly example

Imagine a big factory making food, cement or electricity. Many machines must work in the right order. Sensors act like the factory's eyes. Controllers act like its brain. Motors and valves do the work. Screens help people see what is happening. Industrial automation connects these parts so the factory can be monitored and controlled.

TecLogos's website should make this understandable first, then provide deeper technical details for engineers who want them.

What the redesign must achieve

- Explain what TecLogos does within the first few seconds of the homepage.
- Show the services in clear groups rather than long, crowded paragraphs.
- Explain each service in plain English before introducing technical terms.
- Show real projects, real people, real facilities and verified evidence.
- Help visitors find the right service and contact the company easily.
- Keep detailed technical material on dedicated service pages.

Important research and accuracy note

This document uses information identified on the current and original public websites and the previous website review. Public website copy is not proof of project delivery, certification, partnership status or performance. TecLogos management must approve company facts, technical claims, project examples, statistics, customer names and logos before publication.

Recommended positioning

Proposed headline: **Engineering intelligent systems for a connected industrial world.**
Proposed explanation: **TecLogos brings automation, control systems and engineering services together to help industrial facilities monitor equipment, manage processes and improve operations.**

1. Understand the company before designing the website

What is industrial automation?

Industrial automation means using sensors, computers, controllers and machines to perform or manage work in a factory or plant. Instead of a person manually checking every machine all the time, connected systems can collect information and help operators control the process.

Simple example: a water treatment plant

Part	Simple explanation	Example
Sensor	Measures what is happening.	Measures water level or pressure.
Controller (PLC/DCS)	Makes decisions using programmed rules.	Starts a pump when the tank level is low.
Motor / valve	Does the physical work.	Moves water through a pipe.
SCADA / HMI screen	Shows information to the operator.	Displays tank level, pump status and alarms.
Network	Lets devices exchange information.	Connects sensors, controllers and control-room screens.

Where TecLogos fits

Based on its public website, TecLogos describes engineering and integration work around industrial automation, instrumentation, electrical systems, control systems, building automation and project execution. The website should explain which of these services the company currently delivers directly and which it supports through partners or specialist contractors.

Key terms explained simply

Term	Simple meaning	Website explanation
PLC	A small industrial computer that controls a machine or process.	Controls motors, pumps, conveyors and sequences.
SCADA	A system that lets people monitor and supervise a plant.	Shows live information, alarms and trends.
DCS	A control system spread across many parts of a large plant.	Coordinates complex industrial processes.
HMI	The screen an operator uses to interact with equipment.	Shows buttons, diagrams, status and alarms.
Instrumentation	Devices that measure things such as pressure, temperature and flow.	Helps the plant know what is happening.
BMS	A system that monitors and controls building equipment.	Can manage HVAC, energy and building services.
FAT	A test carried out before equipment is sent to site.	Checks that a system or panel works as specified.
SAT	A test carried out after equipment is installed at site.	Checks the installed system in its real environment.
Commissioning	The process of checking and starting a system safely.	Confirms equipment and controls work together.

2. Existing website review and main changes

The redesign preview has a much stronger amount of business and technical information than the original site. The main issue is that the homepage tries to explain too many details at once. The redesign should keep the useful knowledge but distribute it across a clear set of pages.

Area	Keep	Change
Homepage	Industrial positioning, business pillars, service overview and enquiry CTA.	Reduce repeated technical detail. Add stronger hero imagery and a clear visitor journey.
Solutions	Technical service information, deliverables and platforms.	Give every service a clear overview, image, process, deliverables and case study.
Industries	Industry categories and application descriptions.	Use image-led cards and explain the problem TecLogos solves in each industry.
Technologies	Multi-platform and OEM experience where verified.	Explain what each platform is used for; distinguish experience from official partnership.
Projects	Case-study structure and technical scope.	Publish only verified projects with approved images, scope and outcomes.
About	Company story and values.	Add real leadership, people, history, office and engineering photographs.
Insights	Technical article topics.	Use diagrams, clear article summaries, authors and dates.
Careers	Roles and hiring information.	Show culture, people, genuine openings and a working application route.
Contact	Business enquiry form and office details.	Make the form clear, test submissions and show response expectations only if confirmed.

About Us

Insights

Careers

Contact

Note: routes and page contents can change during development. Re-check all links before launch.

3. Homepage — exact recommended content and layout

The homepage is the front door of TecLogos. It should answer four questions quickly: Who are you? What do you do? Who do you help? How can I contact you?

Recommended homepage order

Order	Section	What the visitor should understand
1	Hero	TecLogos is an industrial engineering and automation company.
2	Short company introduction	What the company does in plain language.
3	Core solutions	The main services available.
4	Industries	The types of plants and buildings served.
5	How projects work	The steps from understanding a need to testing and handover.
6	Technology expertise	The systems and platforms the team works with.
7	Featured projects	Proof of real engineering work.
8	Why TecLogos	Verified reasons to trust the company.
9	Insights / news	Useful knowledge and company updates.
10	Contact CTA	A simple way to discuss a project.

Suggested homepage copy — ready for review

Hero eyebrow: INDUSTRIAL AUTOMATION · ENGINEERING · INTEGRATION

Headline: Engineering intelligent systems for a connected industrial world.

Supporting text: TecLogos brings automation, control systems and engineering services together to help industrial facilities monitor equipment, manage processes and keep operations running.

Buttons: Explore Our Solutions · Discuss Your Project

Company introduction

Heading: Engineering that connects people, machines and processes.

Factories and industrial plants depend on many systems working together. TecLogos provides engineering and automation services that help connect equipment, control systems and operator interfaces. From understanding the requirement to engineering, testing and commissioning, the company supports the stages agreed for each project.

Core service cards

Card title	Plain-English description
Industrial Automation	Systems that help factories and plants monitor and control machines and processes.
Electrical & Instrumentation	Engineering for power, wiring and devices that measure pressure, temperature, flow and other conditions.
Building Automation	Systems that help manage building equipment such as heating, ventilation, air conditioning and energy monitoring.

Card title	Plain-English description
Control Panel Engineering	Designing and assembling electrical cabinets that house control and automation equipment.
Plant Modernisation	Updating older control systems and equipment where the project scope allows.
Testing & Commissioning	Checking that equipment and systems work correctly before handover.

Keep the homepage summaries short. Link every card to a detailed page.

4. Solutions and services — what each page should say

Every service page should follow the same pattern so visitors know where to find information. Start with a simple explanation. Then show the engineering detail for technical readers.

A. Industrial Automation

Simple explanation: Industrial automation helps machines and processes work together using sensors, controllers and computer screens.

Suggested opening: TecLogos provides industrial automation engineering and integration services for facilities that need to monitor equipment, control processes and connect plant systems. The exact scope is defined for each project.

Include: PLC, DCS, SCADA, HMI, control system design, system integration, graphics, migration, testing, commissioning and support — only where confirmed.

B. Electrical and Instrumentation Engineering

Simple explanation: Electrical engineering helps provide and distribute power. Instrumentation uses measuring devices to tell the control system what is happening in the plant.

Include: instrument index, datasheets, I/O lists, loop diagrams, cable schedules, single-line diagrams, load lists, panel drawings and other deliverables actually provided by TecLogos.

C. Building Management Systems

Simple explanation: A building management system helps a building monitor and control equipment such as air conditioning, ventilation and other building services.

Include: BMS/BAS, HVAC controls, DDC, building graphics, integration, energy monitoring, commissioning and maintenance where offered.

D. Control Panel Engineering

Simple explanation: A control panel is a cabinet containing electrical and control equipment. It helps operate and protect machines and processes.

Show the stages: design → component selection → assembly/wiring → inspection → FAT → dispatch/installation, if these stages are part of the company's actual scope.

E. Plant Modernisation and Migration

Simple explanation: Older control systems may need to be updated. Modernisation replaces or upgrades selected parts while planning how to reduce disruption to operations.

Explain assessment, migration planning, hardware/software changes, testing, cutover and post-start-up support. Do not promise zero downtime unless contractually supported.

F. Lifecycle Support and Commissioning

Simple explanation: Commissioning is the process of checking that installed equipment and control systems work correctly together before they are handed over.

Explain site testing, loop checks, functional tests, troubleshooting, documentation, training and maintenance only where offered.

5. Industries — explain the customer's world

An industry page should not just say that TecLogos serves a sector. It should show that the company understands the equipment, process and operational challenges found in that sector.

Industry	Explain it simply	Possible automation context
Power & utilities	Facilities that generate or distribute electricity.	Monitoring equipment, process control, electrical and instrumentation systems.
Oil & gas	Facilities that produce, move or process oil and gas.	Process control, instrumentation, safety-related systems and plant monitoring.
Water & wastewater	Facilities that clean, move or treat water.	Pump control, tank levels, flow measurement and SCADA monitoring.
Cement & minerals	Factories that process raw materials into cement or minerals.	Conveyors, motors, process monitoring and plant control.
Steel & metals	Facilities that make or process metal products.	Machine control, process automation and instrumentation.
Chemicals & petrochemicals	Plants that make products using chemical processes.	Process control, measurement, alarms and integrated systems.

Recommended layout for each industry

- Large image showing the real industrial environment.
- A short introduction using everyday language.
- Three to five common operating challenges.
- The relevant TecLogos services.
- A simple process or system diagram.
- A real, approved project example if available.
- A clear enquiry button.

Do not claim that TecLogos has completed projects in every listed industry unless the company can provide evidence. Separate 'Industries we serve' from 'Industries where we have verified project experience'.

6. Technologies — explain the platform, not just the brand

The Technologies page should help a buyer understand what systems the engineering team can work with. A row of logos alone is not enough.

Platform / term	Plain-English explanation	What the page can show
Honeywell	Industrial and building control technology used in different types of facilities.	Confirmed products, engineering scope and project experience.
Siemens	Automation and control products used in machines, factories and process plants.	PLC, HMI, SCADA or other confirmed experience.
ABB	Automation and electrical technologies used in industrial environments.	Confirmed control platforms and integration work.
Rockwell Automation	Industrial control and automation technologies.	Confirmed controller, software and integration experience.
Niagara / Tridium	A software framework used in building automation and system integration.	Confirmed BMS and integration experience.

Important distinction

Say 'experience with' or 'engineering on' only where accurate. Do not use 'official partner', 'certified partner' or manufacturer partner logos unless there is a current written authorisation or verifiable relationship. A technology logo does not prove partnership.

Recommended visual treatment

- White background and clean technology cards.
- Use product or system photographs only when licensing and accuracy are clear.
- Use a simple architecture diagram to show how sensors, controllers, networks and operator screens connect.
- Provide a short glossary for non-technical visitors.
- Link technology pages to relevant services and case studies.

7. Projects — the strongest trust-building page

A customer wants to know whether TecLogos has solved a similar problem before. The Projects page should provide evidence, not just impressive-sounding project descriptions.

Case study template

Field	What to include
Project title	A clear title that does not expose confidential information.
Industry	Power, water, oil and gas, manufacturing, building, etc.
Location	Only if the customer permits publication.
Customer challenge	What was not working or what needed to be built.
Scope delivered	The exact work TecLogos performed.
Technology	Verified platforms, systems and equipment.
Testing	Relevant FAT, SAT, commissioning or acceptance work.
Outcome	Measured results with evidence, or a factual qualitative outcome.
Images	Approved site photographs, panels, diagrams or screenshots.

A good simple case study

Challenge: A facility needed a way to monitor the status of pumps and tanks from a central control room.
Solution: The engineering team designed and integrated a monitoring and control arrangement using the agreed instruments, controller and operator interface.
Outcome: Operators could view the agreed process information and alarms from the control room.

This is an illustrative example, not a claim that TecLogos completed this particular project. Replace it with a real, approved project.

Project page image checklist

- One strong main photograph.
- Two to four supporting photographs.
- A simplified system diagram with confidential information removed.
- A photograph of the panel or equipment, if approved.
- A commissioning or installation photograph, if approved.

8. About, Careers, Insights and Contact

About Us

The About page should feel human. Visitors should see the people, history and working approach behind the engineering company.

- Company introduction in simple language.
- Why the company was started.
- Verified company timeline and milestones.
- Leadership names, roles and approved photographs.
- Engineering team and working environment.
- Vision, mission and company values.
- Quality, safety and certifications that can be verified.
- CSR activities with real evidence.

Careers

Explain what it is like to work at TecLogos. Show real engineers, actual work environments, current vacancies, role expectations, application instructions and a functioning application process. Do not display expired vacancies.

Insights

Build a small engineering knowledge centre. Suggested articles include: What is PLC automation? What is the difference between PLC and DCS? What happens during FAT and SAT? What is a BMS? What is control system migration? Each article should have a diagram or relevant image, an author, date and a short summary.

Contact

Make it easy to ask for help. Ask only for information the sales team needs to respond: name, company, business email, phone (if needed), service of interest and a short project description. Add optional file upload only if the form securely supports it.

Contact form success criteria

- Form validates required fields.
- Visitor sees a clear success or error message.
- Enquiry reaches the correct company inbox or CRM.
- Spam protection is enabled.
- Privacy notice is visible.
- Telephone and email links work on mobile.

9. Image and video sourcing guide

Use real TecLogos photographs wherever possible. Stock photography is useful for illustrating general industrial environments, but it must never be presented as a photograph of TecLogos, its staff, its customers or its projects.

Recommended image sources

These are search links, not pre-approved individual assets. Open each result, inspect the exact image/video, check its current licence and download terms, and keep a record of the asset source.

Page-by-page image brief

Website section	Search for / photograph needed	Preferred image
Homepage hero	Automated production line, process plant, wide factory interior.	Wide cinematic 16:9 video or high-resolution still.
Company introduction	Engineers discussing drawings, control room, company office.	Real TecLogos team photo preferred.
Industrial automation	PLC cabinet, DCS control room, operator screens, sensors.	Technical close-ups and real control room.
Electrical & instrumentation	Cable trays, instruments, wiring, panel drawings.	Real project or workshop photos.
Building automation	HVAC plant room, commercial building control room.	Building systems, not generic skyscraper images.
Panel engineering	Control panel assembly, wiring, inspection and testing.	Real workshop photographs.
Plant modernisation	Old and new control cabinets, upgrade work.	Approved before-and-after images.
Commissioning	Engineer testing equipment at site.	Real site photographs with permission.
Power industry	Power station, turbine hall, electrical substation.	Wide facility image.
Oil & gas	Refinery, process pipes, industrial plant.	Wide process facility image.
Water	Water treatment tanks, pumps, filters and control room.	Treatment process image.
Cement / steel	Kiln, conveyor, steel mill, production line.	Industrial process image.

Website section	Search for / photograph needed	Preferred image
Projects	Actual project site, panel, diagrams and commissioning.	Real approved project assets only.
About / Careers	Leadership, engineers, office and team activity.	Real company photographs.
Insights	Technical diagrams, engineering illustrations.	Custom diagrams or relevant editorial images.

10. Hero video and visual design system

Hero video recommendation

Use a real industrial environment: a process plant, automated production line, control room or machinery operating in a factory. Avoid generic futuristic animation, glowing circuit graphics and footage that looks unrelated to the company's work.

Requirement	Recommendation
Format	MP4, H.264 for broad browser support.
Composition	Landscape 16:9 or wider; subject should remain visible behind text.
Length	A short loop with a natural beginning/end; usually around 10–20 seconds is enough.
Resolution	1080p is a practical target; use 4K source only if compressed appropriately.
File size	Keep it as small as practical; test on mobile networks.
Playback	Muted, autoplay, loop and playsInline.
Fallback	Provide a poster image and a static mobile/reduced-motion fallback.
Overlay	Use a subtle dark overlay only if white text is placed on the video.
Accessibility	Respect reduced-motion preferences; do not use sound by default.

Background palette

Use	Colour	Where
Primary white	#FFFFFF	Most page backgrounds and main content.
Soft grey	#F4F5F5	Alternate sections and capability groupings.
Cool light grey	#E9EDEF	Subtle technical or comparison sections.
Charcoal	#20272B	Featured projects and selected CTA sections.
Deep charcoal	#171D20	Footer.
Accent	Use approved brand colour	Buttons, small highlights and active states.

Typography and layout

- Use a clean sans-serif typeface such as Inter or IBM Plex Sans.
- Use one clear H1 per page and a consistent heading hierarchy.
- Keep paragraphs short, with generous line spacing.
- Use a 12-column desktop grid and consistent page gutters.
- Use square or slightly rounded image cards; avoid excessive rounded UI.
- Keep section spacing consistent and avoid too many decorative effects.
- Use GSAP only for subtle reveal, image and navigation transitions.

11. How to write so everyone understands

Use a two-layer writing method: first explain the idea in everyday words, then give the technical detail for engineers.

Too technical as the first sentence	Better first sentence
We deliver PLC/SCADA/DCS integration with multi-protocol connectivity.	We connect machines, sensors and control systems so operators can monitor and manage a plant.
We execute instrumentation engineering deliverables.	We design the measuring devices and drawings that help a plant monitor pressure, temperature, flow and other conditions.
We provide BMS integration and DDC application engineering.	We help buildings monitor and control equipment such as air conditioning, ventilation and other building services.
We conduct FAT/SAT and commissioning.	We test equipment before it leaves the workshop, then check the installed system at the site.
We execute brownfield migration.	We help upgrade older control systems while planning how to reduce disruption to the operating facility.

Writing rules

- Use short sentences. Explain one idea at a time.
- Explain an acronym the first time it appears.
- Avoid using five technical terms in one sentence.
- Say what the customer gets, not only what the technology is.
- Use headings that describe the visitor's question.
- Use real facts and examples. Never invent achievements.
- Avoid absolute claims such as zero downtime, guaranteed savings or 100% reliability unless the exact claim is contractually and technically proven.

Recommended content pattern

1. What is it? Explain the service in simple language.
2. Why does it matter? Explain the problem it helps solve.
3. What does TecLogos do? List the actual engineering scope.
4. How does the work happen? Show the steps.
5. What does the customer receive? Explain the deliverables.
6. What proves capability? Show approved projects, team experience or credentials.
7. What should the visitor do next? Provide a relevant enquiry CTA.

12. Company information to collect before final launch

The public website cannot answer every question. Ask TecLogos management and engineering leads to complete this information pack before the final copy is approved.

Information needed	Who should provide it	Why it matters
Official company profile and legal name	Management	Accurate corporate introduction.
Founding story and milestones	Founders / management	About page and company timeline.
Current service catalogue	Business / engineering leads	Avoid advertising services not currently offered.
Actual project list and scope	Project managers	Evidence for case studies.
Project photos and client permission	Project managers / clients	Credible project galleries.
Technology platforms used	Engineering leads	Accurate technology page.
Partner authorisations	Management / procurement	Correct use of partner claims and logos.
Certifications and validity	Quality / management	Verified trust claims.
Leadership biographies and photos	Management / HR	Human company profile.
Employee and office photos	HR / administration	Careers and About pages.
Current job openings	HR	Accurate recruitment information.
Official contact and enquiry routing	Sales / administration	Working forms and contact details.
CSR activities and evidence	Management / CSR owner	Accurate impact reporting.

Claims that require special checking

- Company founding date and incorporation details.
- Employee count, revenue, number of projects and geographic reach.
- SIL capability, functional safety claims and certifications.
- Availability, response-time or service-level promises.
- Energy savings, reliability, uptime and performance statistics.
- Customer names, project locations and logos.
- Official manufacturer partnerships or authorisations.
- Claims such as 100% FAT, zero defects or guaranteed zero downtime.

Rule: if the company cannot provide evidence or approval, rewrite the claim in a factual, non-quantified way or remove it.

13. Recommended website structure

Main page	Suggested child pages
Home	Company overview, services, industries, projects and enquiry.
Solutions	Industrial Automation; Electrical & Instrumentation; Building Automation; Panel Engineering; Plant Modernisation; Lifecycle Support.
Industries	Power; Oil & Gas; Water; Cement & Minerals; Steel & Metals; Chemicals — only where relevant and supported.
Technologies	Confirmed platforms and engineering systems; clearly distinguish experience from official partnerships.
Projects	Project listing and individual approved case studies.
About	Company story; leadership; values; quality and safety; CSR.
Insights	Articles, technical explainers and company news.
Careers	Culture, current openings, internships and application.
Contact	Business enquiry, office details and contact form.

14. Development and launch checklist

Workstream	What must be checked before launch
Content	All copy approved; no placeholder text; no unsupported claims.
Images	Licences checked; real company images labelled correctly; alt text written.
Navigation	All menu items and page links work on desktop and mobile.
Forms	Validation, spam protection, success/error states and email delivery tested.
SEO	Unique titles, descriptions, headings, canonical URLs and sitemap.
Performance	Images compressed; video optimised; lazy loading used appropriately.
Accessibility	Keyboard access, focus states, colour contrast, labels and reduced motion.
Security	HTTPS, secure form handling and no exposed confidential project data.
Analytics	Track quote requests, contact submissions and key CTA clicks.
Launch	Domain, redirects, analytics, search indexing and backup plan checked.

15. Recommended work order

Phase	Work	Output
1. Verify	Management interviews, service validation, claims and asset collection.	Approved company facts and content source.
2. Structure	Final sitemap, navigation and page templates.	Approved information architecture.
3. Design	Homepage, service template, industry template and project template.	Consistent responsive design system.

Phase	Work	Output
4. Build	Pages, components, CMS/content workflow, forms and animations.	Working website.
5. Populate	Approved copy, real images, diagrams and case studies.	Complete content.
6. Test	Mobile, accessibility, SEO, performance, links and form delivery.	Launch-ready website.
7. Maintain	Update insights, vacancies, projects and company information.	Current and useful corporate website.

16. Final recommendation

Do not throw away the research and technical detail already added to the Vercel redesign. Keep the useful engineering information, but organise it so that a first-time visitor can understand the company without needing an engineering degree.

The final website should work for two audiences at the same time:

For a first-time visitor: simple explanations, clear services, industries, real photographs and an easy way to contact TecLogos.
For an engineer or project buyer: detailed capabilities, platforms, deliverables, standards, project evidence and technical resources.

The guiding principle

Make complex engineering easy to understand. Make real expertise easy to verify.

Suggested image file naming

Use descriptive filenames so the asset library remains organised:

teclogos-home-hero-factory-video.mp4
teclogos-home-hero-poster.webp
teclogos-industrial-automation-control-room.webp
teclogos-electrical-panel-engineering.webp
teclogos-bms-building-automation.webp
teclogos-project-power-plant-approved-01.webp
teclogos-team-engineering-workshop.webp

Suggested image quality and handling

- Use WebP or AVIF for website photographs where supported.
- Keep original high-resolution files in a separate asset archive.
- Create appropriately sized responsive versions.
- Use descriptive alt text that explains the image's purpose.
- Keep a simple spreadsheet recording source, licence, photographer, date and page usage.
- Obtain written permission for employee, customer and project photographs.
